Do you lack time or resources for continual **IT security processes?**
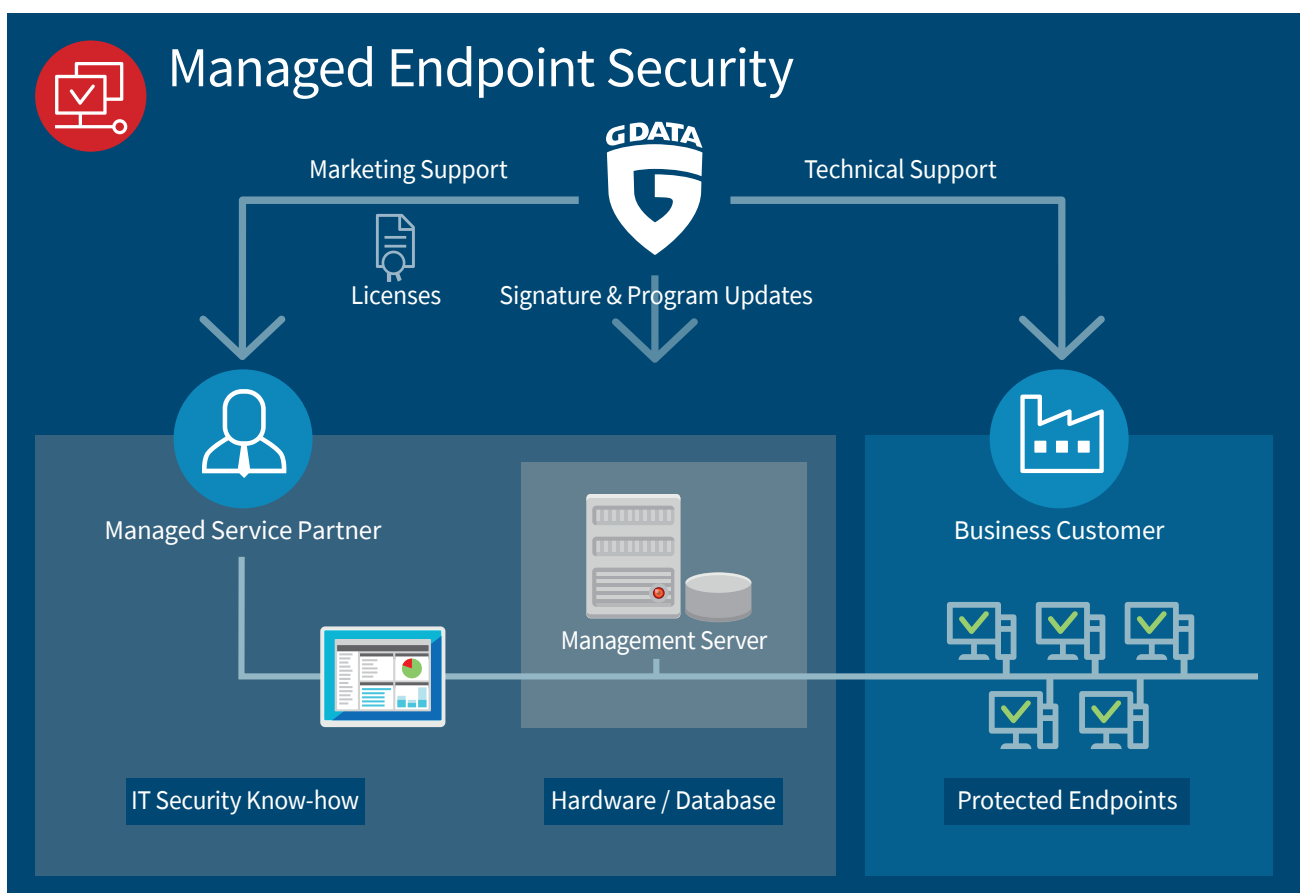

Combine the best protection for business customers with the convenience of managed security services

Managed Endpoint Security enables our customers to outsource their IT security to G DATA experts and focus on their core business in a cost-effective way and without administrative downtimes interrupting their day-to-day business.

G DATA offers everything from a single source and handles every task, from rolling out the IT security solution on the endpoints to configuring the firewall. At the same time, they are the direct contact for all licensing questions and provide expert advice from trained personnel in the event of an

emergency. The endpoints of each customer are connected to their own G DATA Management Server, which centrally monitors the security status of the network and regularly delivers new signatures to the endpoints. G DATA operates this server in its data center and provides the connection of the endpoints via internet.

This not only saves our customers hardware costs for the server, but also eliminates the need to worry about availability and maintenance.
